Selection of Cemented Carbides for Wire Drawing Dies.
I. A. Yushkova. Henry Bratcher, Translation No.
2319, 1949, 12 pages. From Stal (Steel), v. 7, Aug.
1947, p. 737-741.

Presents experimental study of optimum Co con-
tent of WC dies for drawing steel wire. Describes
preparation of die blanks and dies. Results are
tabulated and discussed.

Yukhvets, Izrail' Abramovich

Volochil'skoye proizvodstvo, Ch. II (Cold Drawing, Pt. 2) Moscow, Metallurg-
izdat, 1960. 286 p. Errata slip inserted. 4,700 copies printed.

Ed.: V. I. Bogolyubskiy; Ed. of Publishing House: V. M. Gorodinchenko;
Tech. Ed.: P. G. Isalent'yeva.

PURPOSE: This textbook is intended for students of metallurgical tekhniums,
and can also be of use to technical personnel of metal drawing shops.

COVERAGE: This second volume of the textbook presents methods for
metal drawing and thermal treatment of wire, rods, and pipes, and dis-
cusses coating and finishing operations. The author also points out re-
quirements for finished products and quality inspection and provides
data for planning drawing shops. Information is given on the properties of
metals and what always is and gives its characteristics.
V. I. Bogolyubskiy, N. I. Kadykov, S. A. Zalogin and others

institutes, and planning and design organizations. It may also be used by students at schools of higher education.

COVERAGE: Volume 2 of the handbook reviews problems connected with the preparation of metal for rolling, the quality and quality control of rolled products, and designs of roll passes in merchant mills. The following topics are discussed: processes of manufacturing semifinished and finished rolled products (the rolling of blooms, billets, shapes, beams, rails, strips, wire, plates, sheets, and the drawing of steel wire), hot-dipped tin plates, lacquered plates, floor plates, tubes made by different methods, and special types of rolled products. Problems of the organization of rolling operations are reviewed, and types of rolled products manufactured in the USSR are shown. No personalities are mentioned. There are no references.

Title: The PHC-2 (PGC-2) Mass Spectrometer Designed for
 Studying Chemical Reactions and the Determination of
 Free Radicals.

Periodical: Primary i. tchnika eksperimenta, 1960, No. 6, pp. 78-84

Text: A double magnetic mass-spectrometer designed for studying
 reactions in the gaseous phase and, in particular, for the
 determination of free radicals is described. Two methods are used
 to produce the ions. In the first method the mixture to be
 analyzed is ionized by charge transfer to specially produced ions.
 The latter are formed in a separate ion gun by means of electron
 bombardment and are mass-analyzed in a small magnetic analyzer.
 In the second method the mixture under consideration is ionized
 directly by electron bombardment. Quasi-molecular dissociation is
 achieved by a method based on that reported by Yoz et al. (Ref. 1).
 The gas from the reactor is introduced into the ion source as the
 Card 1/6

form of a molecular beam which is mechanically interrupted at a
 known frequency. In distinction to the method described by Yozar
 and Baden (Ref. 1), in which the molecular and ion beams are
 perpendicular, in the present system the two beams are coaxial,
 which means that smaller voltages are necessary for the extraction
 of the ions from the ionization region and it is possible to reduce
 the intensity of the background mass-spectrum. A particular feature
 of the present instrument is the use (in the measuring part of the
 spectrometer) of stabilization of parameters such as the
 accelerating voltage, the voltage supplying the detector, the
 ionization current of the ion gun cathode, and the supply voltage for
 the ion source cathode. This was described by the second of the
 present authors in Ref. 10. The mass numbers are determined from a
 knowledge of the magnetic field which is measured with the
 aid of a Hall probe (Germanium crystal). The basic mass spectro-
 metric arrangement employed is shown in Fig. 2. Products of
 chemical reactions taking place in the "reactor" I enter the
 region II through small porture in the thin glass diaphragm

TITLE:

The Machining of Outside Surfaces of Revolution by the Electro-contact Method.

PERIODICAL: Stanki i Instrument, 1960, No 5, pp 18 - 21

TEXT: In this article the authors give an account of the main results of investigations which were carried out by the ENIMS (Experimental Scientific Research Institute of Metal Cutting Tool Machines) on the machining of surfaces of revolution by the electrocontact method. As it is shown in Figure 1 the law out of this method is identical with the treatment of machine parts on cylindrical grinders or the milling of bodies of revolution with the aid of cylindrical milling cutters with longitudinal feed. In order to obtain an uninterrupted feed per minute (mm/min) is determined by the formulae:

$$s_{\text{long}} = s_{\text{ob}}^n \quad \text{or} \quad s_{\text{long}} = \frac{s_v}{\pi D_b},$$

Card 1/5

The Machining of Outside Surfaces of Revolution by the Electrocontact Method

where s_o is the longitudinal feed in mm per revolution of blank, n_p is the number of rpm of the blank, v_b is the peripheral speed of the blank in m/min, and D_b is the diameter of the machined blank. The tests were carried out on a pilot installation based on the model L220 lathe as shown in Figure 2. The authors give a description of the device and pertinent technical data. The electric circuit of the installation is shown in Figure 3. The investigation had an aim to solve the following principal problems: 1) the evacuation of metal from the zone of machining and the selection of the disk profile; 2) the elucidation of optimum technological and the selection of the disk profile; 3) macro-geometry of the machined surface; 4) the effects of process conditions and physical-mechanical properties of the initial metal on the micro-structure changes of the machined surface layer in the zone of thermal effect. The tests were carried out with the heat-resistant and stainless steel grades 1Kh13, 2Kh13, 1Kh18N9T, 1Kh18N12T, and Kh18, and for a comparison, with the 15 grade steel. During the investigation it was found that the optimum conditions for a regular and normal evaluation of metal from the operating zone existed, if the disk was revolving in the direction indicated by the arrow.

Card 2/5

The Machining of Outside Surfaces of Revolution by the Electrocontact Method

zone against the peripheral feed. The authors analyze the effects of the shape of operating surface of the disk on the evacuation of metal from the operating zone and compare the efficiency of various shapes, shown in Figure 4. Figure 5 shows the necessary capacity of the power transformer as a function of the longitudinal feed of the operating disk, for a constant width of the layer taken off being 9 - 10 mm and a voltage of the transformer current running of 31.5 - 32 v. The oscillograms of current and voltage in Figure 6 show that raising the necessary power with an increased feed results in an increase of the number of discharges. Figure 7 shows that an increase in the power consumed by the transformer with an increased feed results in a reduction of specific power consumption in the process. In Figure 8 the effect of peripheral feed (peripheral speed v_b of the blank) on the specific electric power consumption q_1 is shown. The specific electric power consumption decreases with an increase of the peripheral speed until it reaches a minimum. With a further increase of the peripheral speed the specific electric power consumption somewhat increases. The maximum power required by the transformer is determined by the formula $N = 0.06 n s_0 t v \gamma q$, where n is the number of simultaneously operating disks, γ is the specific gravity of the metal machined and q is

Card 3/5

80032

S/121/60/000/05/01/005

The Machining of Outside Surfaces of Revolution by the Electrocontact Method

the specific electric power consumption in kWh/kg. The authors state the various formulae for the calculation of the temperature conditions prevailing in the operating zone. The tests showed that, in order to maintain a permissible average temperature of the operating disk, it is necessary to subject it to intensive water cooling. Formulae for the rating of the coefficient of heat emission, if the disk is cooled by water, are given, as well as the coefficient of heat emission for the air-cooled blank. Measurements of the magnitude of macro-roughness of the machined surface were carried out with the aid of an indicator along the evolute of the periphery of the blank through every 1 mm along the axis through every 1 mm. The maximum height of unevenness after electrocontact machining of 1Kh18Ni2T grade steel did not exceed 0.5 mm. By metallographic analysis it was found that after electrocontact machining of stainless and heat-resisting steel grades 2Kh13, 3Kh13, Kh18, 1Kh18N21, and 1Kh18N9T, the microstructure of the surface layer possessed a fine dendritic structure characteristic for molten metal. Electrocontact treatment resulted in an increased surface hardness; corresponding figures for the various steel grades are given. The authors conclude that the most efficient field of

application of contact arc treatment of surfaces of revolution is the rough and semi-finished machining of castings and other blanks of steel grades and alloys which are difficult to tool, and they point out that in spite of the relative increase of electric power consumption, the cost price of machining labor-consuming metals decreases by 2 - 3 times in comparison with lathework. TITLE: A Method of Producing Power From Beta-Active Isotopes
(Ob odnom metode energeticheskogo ispol'zovaniya beta-aktivnykh izotopov)

PERIODICAL: Tr. n.-i. in-ta M-vo radiotekhnich. prom-sti SSSR, 1956,
Nr 6 (36), pp 3-8

ABSTRACT: Two types of atomic power sources based on β -radiation utilization are known: (1) a well-insulated electrode is directly charged by β -particles; (2) β -particle energy is transformed in a semiconductor into the energy of a great number of relatively slow electrons. The disadvantages of the first method — a high internal resistance of the atomic battery (on the order of hundreds of megohms) — and of the second method — a low efficiency — are pointed out. A new method is suggested, based on the charge accumulation created by β -radiation in an electric capacitor. A charged capacitor is periodically discharged by a switching device onto an impulse transformer, the secondary

Card 1/2

SOV/112-58-2-2525

A Method of Producing Power From Beta-Active Isotopes

winding of which supplies a load. A simplified scheme of an atomic battery is presented; its power and efficiency are calculated; with 10^5 curie β -source activity, with an average β -particle energy of 100-kev, and with a 100 μ uf capacitor, the optimum charging time that corresponds to the maximum efficiency (20.5%) is 20 microseconds, the capacitor voltage is 70 kv, and the mean output power is 13 w. With a 10:1 transformer ratio, the equivalent battery resistance is on the order of hundreds of ohms. The S³⁵ sulfur isotope, with an average energy of about 100 kev and a half-life of 87.1 days, is recommended as a source of β -radiation. Bibliography: 8 items.

Mass-spectrum Analysis of Gaseous Mixtures on an Apparatus of the MAGS-2 Type (Mass-spektral'nyy analiz gazovykh smesey na pribore tipa MAGS-2)

PERIODICAL:

Zavodskaya Laboratoriya, 1957, Vol. 23, No. 1, pp. 35-41 (U.S.S.R.)

ABSTRACT:

The author names five Soviet apparatuses for spectrum analysis of gas: MS-1, MS-2, MS-2M, MS-3 and MS-4 and then points out the superiority of the MAGS-2. This apparatus consists of a sole unit of a single-beam mass spectrometer with a sector magnetic field of the system of admitting the gas mixture to be analyzed into the source of ions under the molecular inflow (5) method and a system of automatic recording of the spectra of the masses. The apparatus is designed for analysis of gas mixtures with molecular weight up to 80, and can also be used for isotope analysis of elements or their compounds. The parts of the apparatus are described, with graphs and diagrams: mass spectrum of krypton, block diagram of the gas analyzer, system of magnetic deflection of the ion beam, general

TITLE

Attainment of a Microhole in a Thin Metal Foil.
(Polucheniye mikronnykh otverstiy v tonkoy metallicheskoy
fol'ge.)

PERIODICAL

Zavodskaya Laboratoriya, 1957, Vol.23, Nr 8,
pp. 976-977 (USSR)

ABSTRACT

For this purpose the paper recommends to spread the metal foil on a hard base plate. At the desired place one or more impressions are made by a pyramidal or conic body by fixed load. By careful etching of the impressions microholes are obtained which may be enlarged according to the time of etching. The accelerated etching of the foil in the holes may be explained by the fact that the etching is not only favored by a thinning of the foil in these places, but also by the plastic deformation to which the material in these spots is subject. For the purpose of attaining microholes with stable edges of clean forms an unforged, burned-off foil is used. Very important in this connection is also the absolute purity and hardness of the base plate, as well as the kind of etcher and the etching regime. In this manner holes of 30-40

CARD 1/2

32-8-37/61

Attainment of a Microhole in a Thin Metal Foil.

may be obtained in aluminum, molybdenum, zirconium and chromiumnickel foils of a thickness of 7,5-20 μ . It is stated here that even holes of 1 μ may be made, but that their accurate observation through the microscope is rendered difficult due to the occurrence of interference phenomena. In this manner are, e.g., attained the micronets (of 3-4 μ) for gas analizers etc.

TITLE: A Metallic Ampoule System (Metallicheskaya ampul'naya sistema)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1958, Nr 5, p 105 (USSR)

ABSTRACT: The disadvantages of glass ampoule systems as used in mass-spectroscopic analysis of gases are well known. The most important of them involve sorption and desorption of gases and the presence of grease. Furthermore, glass stop-cocks and ground glass joins do not have a very high degree of mechanical stability and are not sufficiently hermetic. On the other hand, metallic vacuum systems do not have these disadvantages. In their usual form they include joins which are sealed by means of metal packing. The join described in the present paper employs a new type of compression in which the plastic deformation of the packing is produced by means of a quick-acting

TITLE: On the possibility of an experimental check of the relativistic effect of setting a "traveling clock" by means of quantum frequency and time standards

SOURCE: Kosmicheskiye issledovaniya, v. 4, no. 4, 1966, 644-647

TOPIC TAGS: atomic clock, general relativity theory, special relativity theory, gaseous state maser, time measurement, space time

ABSTRACT: The possibility of setting up an experimental check of the effect of setting a "traveling clock" is examined. Two atomic clocks A and B are considered. The generators of the clocks, which are in a frame of reference linked with the earth, are brought together in frequency and phase at the initial moment, so that the initial readings of the clocks coincide. The setting of clock B as compared with the readings of clock A after landing must be:

$$\text{where } \Delta T \approx \frac{1}{2} \beta T,$$

$$\beta = \frac{v}{c}.$$

TITLE: A method for displaying superhigh frequency radiation. Class 21, No. 122555

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 23, 1966, 169

TOPIC TAGS: superhigh frequency, homogeneous magnetic field, nonhomogeneous magnetic field, PHYSICAL BEAM

ABSTRACT: This Author's Certificate introduces a method for displaying superhigh frequency radiation by registering the number of particles in a beam of electrically neutral paramagnetic particles which are reoriented in a superhigh frequency field. The procedure provides for highly sensitive display with low set noises and wide-range tuning of the working frequency. The beam of paramagnetic particles is first passed through a nonhomogeneous magnetic field for spatial separation and isolation of particles with a given orientation of the magnetic moments. The beam then passes through a controllable homogeneous magnetic field where the particles interact with the superhigh frequency field of an induced signal on the paramagnetic resonance frequency. The beam finally passes through a nonhomogeneous magnetic field which isolates the particles directed toward an atomic indicator.

TITLE: Surface Saturation of Steel with Boron from a Gaseous
Medium (Poverkhnostnoye nasyshcheniye stali borom iz
gazovoy sredy)

PERIODICAL: Metallovedeniye i Termicheskaya Obrabotka Metallov,
1959, Nr 4, pp 45-47 + 3 plates (USSR)

ABSTRACT: The authors of this paper investigated exhaustively the
problem of borating of metallic surfaces by B_2H_6 for the
purpose of determining optimal conditions of obtaining
layers of high quality. The experiments and the experi-
mental apparatus are briefly described. The possibility
was established of borating from the gaseous phase, using
as a circulation medium a mixture of B_2H_6 and hydrogen.
The best results were obtained with the following
regime: borating temperature 800 - 850°C; process
duration 4 - 5 hours; ratio of the gas mixture $B_2H_6:H_2 =$
Card 1/2 1:75; gas flow rate 75 - 100 litres/hour.

SOV/129-59-4-9/17

Surface Saturation of Steel with Boron from a Gaseous Medium

Under such conditions a 200 micron thick borated layer of a high hardness is obtained. The microhardness of the layer at the surface reaches the value of 3000.

TITLE The Critical Phenomena connected with Heat Transfer in the
Current of not Boiling Water for an Annular Duct.
PERIODICAL Zurn. techn. fiz., 26, 1542-1555 (1956)
Publ. 7 / 1956 reviewed 8 / 1956

The coefficient for the heat transfer from the heating surface to the not boiling water is computed for an annular duct in accordance with

$$\text{Nu} = 0,023 \text{ Re}^{0,8} \text{ Pr}^{0,4} \left(\frac{d_1}{d_2} \right)^{0,5}$$

The heat current securing the beginning of the boiling process is $q_{A.K.}$.

The coefficient of the heat transfer is, as experiments showed, a function of the heat current. The critical heat current is that in which the steam bubbles form a layer of steam between the solid surface to be cooled and the liquid current. At the critical point of the heat transfer the coefficient of heat transfer decreases considerably, but the temperature of the surface to be cooled rises accordingly. In experiments the amount of the critical heat current is therefore determined by the conditions on which the heat-giving element burns through. These conditions are characterized by: w (m/sec) - velocity of the not boiling water entering the domain of operation; t_w ($^{\circ}\text{C}$) - average water temperature when leaving the domain

Zurn. techn. fis., 26, d₁ 1542-1555 (1956)

CARD 2 / 3

PA - 1209

of operation; $\delta = \frac{d_1 - d_2}{2}$ (mm) - size of duct between the outer tube
(d_1 mm) and the cylindrical heat-giving element (d_2 mm); P (atm overpr) -
pressure at which the experiment was carried out.

The tests made for the purpose of determining the dependence

$q_{kr} = f(w, t_w, \delta, P)$ kcal/m²h⁻¹ were carried out on two testing stands:
one up to a pressure of 6 atm. overpressure, the other up to about 20 atm.
overpressure. A pump conveyed the distilled water by way of a container and
preheater to the place of operation, from where the water reaches the
measuring vessels by way of a cooler, after which it returns to the pump.
The plant was fed by means of transformers of from 10 to 220 V and 500 A.
Measurements were carried out for: water consumption at the input, water
temperature at in- and output of the range of operation, pressure in its
center part, pressure gradient at the heat-conducting element and the
electric output used for heating the element. The quantity of heat trans-
ferred by the water was computed from $Q = gc(t_w - t_1)$ kcal/h⁻¹ and was
checked by electric measurements. The critical heat current was deter-
mined according to $q_{kr} = \frac{0,86 \cdot 0,55}{f} I U$ kcal m⁻²h⁻¹. At the critical point
of heat transfer the heat-conducting element burnt through and the circuit

Zurn. techn. fis., 26, 1542-1555 (1956)

CARD 3 / 3 PA - 1209

was broken. At this moment all necessary quantities were measured. The values of the critical heat current were measured in dependence of the velocity of the cooling water w (m/sec) for various ducts at a pressure $P = 1$ ata and a water temperature of $t_w = 55 - 60^{\circ}$ C. It was found that w diminishes with an increase of the duct after which it does not change any more after the quantity $n = 0,384$ at $\delta \approx 2,5$ mm has been attained: $n = f(\delta)$. This function is a hyperbolic curve. Next, tests were carried out at equal velocities and diameters of duct, but for different temperatures of water at the output; graphically plotted they resulted in a straight line. Finally, curves were recorded for a pressure of up to 20 ata and in dependence on water temperature at a water velocity of less than 4 m/sec. The critical heat current in dependence on pressure can be expressed by the temperature of subheating ($t_k - t_w$). In order to determine the dependence $q_{kr} = f(t_k - t_w)$ test points for various pressures were plotted in the coordinates $q_{kr} = f(t_w)$. Investigations were carried out with the cooling water moving from below upwards and vice versa; on this occasion it was found that the direction of the current exercises no influence on the critical heat current. Likewise the dependence of the latter on roughness was examined.

TITLE: Direct Synthesis of Alkyl- and Arylchlorosilanes¹

PERIODICAL: Tr. Vses. elektrokhim. in-ta, 1958, № 62, pp 5-15

ABSTRACT: In the direct synthesis of methylchlorosilane the best results were obtained with the molten Si-Cu contact mass (2 - 1.5 Cu, temperature 275°C, yield $(\text{CH}_3)_4\text{SiCl}_n$ (I) 9%), content of I ($n = 2$) 35%. Instead of pure Si the application of ferrosilicon is possible; at a Fe content of 7 and 24.2% the yield and the content of I ($n = 2$) is 85 and 31.7%, and 80 and 24.4, respectively. The reaction depends on the physical structure of the contact mass, the reactor design, the gas supply rate, the temperature, etc. The most efficient contact mass is prepared by pouring the Si-Cu melt into cold water. The introduction of CuO (instead of Cu) into the contact mass increases the yield of I ($n = 3$). CuO is no catalyst. With an increase in the number of organic radicals the heat-resistance of organochlorosilanes decreases. The direct synthesis of ethylchlorosilanes (250 -

Card 1/2

- 270°C) leads to $(\text{C}_2\text{H}_5)_4\text{SiCl}_n$ (II), yield 5 - 10%. The addition of Cr (4.2%) to the Si-Cu alloy increases the quantity of II to 20%. Silane is obtained from $\text{CH}_2 = \text{CHCl}$ ($410 - 420^\circ\text{C}$) as principal product; the yields of $\text{C}_2\text{H}_5\text{SiCl}_3$ and $(\text{C}_2\text{H}_5)_2\text{SiCl}_2$ are 7.3 and 0.9%, respectively. At passing $\text{C}_2\text{H}_5\text{Cl}$ through a Si-Cu alloy ($520 - 435^\circ\text{C}$), activated by HgSO_4 , $\text{C}_2\text{H}_5\text{SiCl}_3$ is obtained with a yield of 18 - 25%. The modes of the reactions of direct synthesis and the mechanics of the action of a copper catalyst are discussed.

TITLE:

The interpretation of vertical electric sounding curves
with a general-purpose digital computer

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,
no. 4, 1962, abstract 4-1-96 1 (Uch, zap. Rizhsk. po-
litekhn. in-t, 1961, 5, 57-70)

TEXT: Curves obtained by the electrical methods of geophysical
prospecting (vertical electrical sounding) enable the basic parame-
ters of a geological layer to be determined. The method consists of
comparing the experimental curves with theoretical ones when they
are superimposed. The coordinates of the intersections of the ex-
perimental curves, obtained by sounding, with supplementary curves
drawn on a tracing paper together with the theoretical ones make it
possible to determine the parameters of a layer. This problem is
closely related to pattern recognition. The results of work on the
use of an M-3 (M-3) computer to solve this problem are described.

The interpretation of ...

The sum of the absolute values of differences in the corresponding ordinates is chosen as a quantity characterizing the degree of divergence between the curves. This sum corresponds to the area between the curves. The curves are described in the form of tables, stored in external memory. Shifting of a curve along a coordinate axis is obtained by adding a constant. Three methods of superimposing the curves are discussed: 1) constrained shifting of curves to positions defined in advance; 2) shifting of curves to different random positions; 3) constrained displacement of the curve in a direction which reduces the divergence criterion. The last method was used. The complexes of operations which are needed for the interpretation of the curves are represented as operators in an overall logical scheme. All operators are explained in detail. Some data on the interpretation program are given. The program contains 550 instructions and the processing time of one curve is 5.5 hours. The prospects for the construction of a specialized interpreter computer are indicated. 1 figure. 3 references. / Abstracter's note: Complete translation. 7

TITLE: Interpreting the curves of vertical electric sounding
on universal electron digital computing machines

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 7, 1962, 32, ab-
stract 7A210 (Uch. zap. Rizhsk. politekhn. in-t, 5,
1961, 57-70)

TEXT: The author states the results of investigating whether the process of interpreting vertical electric sounding curves can be automated by using electron digital computing machines (EDCM). The main stage in the interpretation of experimental vertical electric sounding curves is their matching with theoretical curves and the determination of the degree of their coincidence. The sum of the absolute values for the differences of ordinates, corresponding to the same abscissas of both curves, was taken as the quantity, characterizing the degree of the curves' divergence. The principle of the possibility of using EDCM to interpret vertical electric sounding

Card 1/2

Interpreting the curves ...

S/169/62/000/007/068/149
D228/D307

curves is clarified together with the difficulty of solving this problem. Very numerous operations are required to develop a criterion for the divergence of vertical electric sounding curves if ordinary EDCM are used. To avoid this it is necessary to investigate the question of the most rational algebraic rhythm that can be used in the machine. A known threshold value for the divergence criterion can be introduced for this purpose; it is also possible to use pre-selection if the number of ordinates is decreased. To decrease the dimensions of the special machine as compared with universal EDCM, the precision of the calculations may be somewhat decreased. Then certain additional devices are also necessary. To control the machine's operation it is expedient to introduce a device, allowing the position of the curves during their combination to be followed on the cathode-ray tube's screen, and also an appliance that allows this process to be manually corrected. A device is necessary, too, for automatically feeding the experimental curves into the machine.

TITLE: Conference on New Methods of Making Lead (Soveshchaniye po novym metodam polucheniya svintsa)

PERIODICAL: Tsvetnyye Metally, 1958, Nr 9, pp 72 - 75 (USSR)

ABSTRACT: A conference on new methods of lead production from concentrates was held at the Gintsvermet on June 22-25, 1958. Since the last meeting in 1953, over 20 flowsheets and variants have been tested by various works and organisations and the purpose of the present meeting was to evaluate this work. Pre-prints of the following reports had been circulated: "On Electric Smelting of Lead Raw Materials" by A.P. Sychev, v.A. Mikheyev, D.A. Sushchinskiy of vNIItsvetmet, A.V. Yukov of Kavkazgiprotsvetmet; "On Precipitation and Reaction Smelting of Lead Concentrates" by V.P. Lidov, L.A. Blinova, N.F. Smirnov, I.M. Kudryashova of Gintsvermet, I.R. Polyvyanyy et al. of the Institut metallurgii i obogashcheniya AN KazSSR (Institute of Metallurgy and Beneficiation of the Ac.Sc. KazSSR); "On Hydrometallurgical Treatment" by A.N. Vol'skiy, R.A. Aracheva, A.M. Yel'yanov, F.S. Tsvetkov, F.M. Loskutov and v.S. Lovchikov of Mintsvetmet; and A.V. Pomosov, A.I. Levin et al. of the Ural'skiy

politekhnicheskiy institut (Urals Polytechnic Institute); on the "Electrolytic Production of Lead by Electrolysis of Fused Salts" by I.G. Gul'din, A.V. Bushinskaya, v.P. Barinova and v.K. Ruppul' of Gintsvermet and V.N. Delimarskiy, I.D. Panchenko, Ye.B. Gitman and A.A. Klimov of IONKh Ac.Sc. Ukrainian SSR. The conference was opened by D.M. Yukhtanov, deputy director of Gintsvermet, who discussed recent progress and noted that predictions that the lead industry would develop in the direction of the hydrometallurgical treatment of flotation concentrates had not been fulfilled; he said that the most highly developed of the new methods were electric smelting and electrolysis of fused material and that pyrometallurgy would retain its importance for a long time. In the discussion that followed, D.M. Chizhikov, corresponding member of the Ac.Sc. USSR, systematized and reviewed all known processes. P.A. Pozdnikov and A.A. Vlascova of Ural described methods of treatment developed there; the high effectiveness of which was doubted by v.A. Karchevskiy of Giprotsvermet and S.I. Sobol' of Gintsvermet.

Card2/5

Conference on new Methods of Making Lead SOV/130-Sc-9-16/21

A.M. Zykov of the Leningrad Polytechnic Institute criticised the reports presented as being insufficiently analytical. G.P. Vyatlev of the Ukrtsink Works recommended the adoption of electric instead of shaft smelting of secondary lead materials at the works. A.N. vol'skiy, Corresponding Member of the Ac.Sc. of the Mintsvetmetzlo to described work he had directed there on sulphide oxidation and recommended more attention to safety aspects.

V.F. Fedorov of the GNTK USSR drew attention to the comparative lack of work in the Soviet lead industry on new methods, but opposed the proposal by Gintsvetmet to build a new, large electric furnace at the Leninogorsk Works. P.I. Kravchenko of the Elektrotsink Works deplored the incompleteness of all the work reported at the conference. A.M. Lomov of Kavkazgiprosvetmet considered the adoption of electric smelting of lead concentrates and I.D. Panchenko of IONKh of the Ac.Sc. Ukrainian SSR with electrolysis of fused salts. F.M. Loskutov, Professor, Doctor of Technical Sciences of Mintsvetmetzlo to reminded the conference that electric smelting is not applicable to all materials and disagreed with Kostin's suggestion that all Soviet works should be converted to

Card3/5

Conference on New Methods of Making Lead

SOV/136-58-9-16/21

this practice; he also spoke against alkali treatment of lead-containing materials - a view opposed by G.C. Zapevalov of the Irkutskiy Gorno-metallurgicheskiy institut (Irkutsk Mining-metallurgical Institute) who also stressed the need for economic evaluation. M.A. Chernyak of Giprotsvetmet doubted whether electric smelting could revolutionise the lead industry and urged more research on the alkali process and sintering. I.V. Paramonov of the Gosplan of the KazSSR criticised the research work reported but D.N. Klushin of Gintsvetmet said that this work had gone a long way to realise the aims set out at the previous conference though much effort had been wasted. Many speakers deplored the lack of central direction of research work. After putting on record their views on the proposed methods, the conference decided that effort should be concentrated on the study and development of

- a) electric smelting of primary lead raw materials with added fluxes and electric smelting of secondary materials;
- b) electrolysis of lead concentrates in fused electrolytes (for the rich materials of the "Elektrotsink" and Sikkali Works);
- c) electrolytic refining of lead in aqueous
